

Six-pitch lefty who owned AAA (3.79 ERA, 22.5 K%) on a flat, low-slot fastball and a gyro slider — then got hit hard in Pittsburgh (7.64 ERA, 4 HR in 17.2 IP, all to righties). The stuff didn't change between levels; the fastball shape and the walks did him in against big-league RHH.

USAGE BY BATTER SIDE

VELO TREND

FASTBALL VELO BY MONTH (mph)

WHO HE WAS IN 2026

- The fastball is the whole story.** 93.1 mph from a 22° arm angle and 5.3 ft release: 11.7" IVB / 14.5" run is a dead-zone four-seam — 4" short of the MLB LHP ride average. AAA hitters missed it 20% of the time; MLB hitters 15%, with 52% hard-hit and a .431 xwOBA on it.
- He already owns the fix.** The sinker (7.5" IVB / 16.5" run) went 87% ground balls and 30% CSW in the big leagues. Same slot, same velo, one seam-orientation change away from the four-seam.
- The gyro slider (81.6, -3.5 / -2) is his best swing-and-miss pitch at AAA (31% whiff, 26 K)** but fell to 17% whiff at MLB when he couldn't land it (34% zone). The sweeper (-11" HB) gets 32% whiff but is a LHH-only pitch (16% vs L, 2% vs R).
- Two arm-side offspeeds, neither finished.** Changeup 85.7 / 15" run — soft contact (79 EV, 18% hard) but only 36% zone. Splitter at 723 rpm — 27% whiff at AAA, 100% hard-hit on 1 MLB ball in play. Pick one.
- Walks follow him everywhere:** 11.3% at AAA, 14.9% at MLB, first-pitch strike 57%. Slider zone rate dropped 9 points between levels.
- Velo faded.** Fastball 93.7 in April → 92.5 in September (-1.2 mph) across ~97 combined innings, his biggest workload as a pro.

OFFSEASON PLAN — WHAT WE FIX every item is tied to a 2026 number; nothing gets credited until game data confirms it

MOCAP & DELIVERY

- Full delivery capture: 5.3 ft release at 22° is low for a 6'4" frame — check trunk tilt and shoulder abduction to see if the slot is a choice or a compensation.
- Measure pelvis-trunk separation and lead-leg block on force plates; the -1.2 mph in-season fade points at a delivery that leaks efficiency when fatigued.
- Compare the four-seam and sinker releases frame by frame — if they already match, the shape change is a pure grip/seam job.

PITCH SHAPES & GRIPS

- Make the sinker the primary vs RHH** and re-cue the four-seam as a north-only pitch: target +3" IVB (to -15) via seam orientation on the Edgertonic. Success = whiff% ≥ 22 and hard-hit% < 40 in game.
- Kill the splitter, finish the changeup:** keep the 15" of run, chase 84-85 mph and a 45%+ zone rate so it's usable early in counts vs RHH.
- Bring the sweeper to righties** as a backfoot/chase pitch — it's 32% whiff and he only shows it to lefties.
- Lock the gyro slider's release height (5.2 ft) so the 34% MLB zone rate comes back up to the 43% he had at AAA.

STRENGTH & WORKOUTS

- Bulk/posterior-chain block through December; re-test FB velo at ~93.5+ in January pens before shape work starts.
- Grip/forearm and scap endurance work aimed at the late-season velo and IVB drop (11.5" Aug → 9.7" Sep).
- Build a 100-IP conditioning plan for 2027 — he's never carried a full starter's load at AAA/MLB.

BULLPENS & PLAN

- Pens ordered: sinker command first (arm-side edge to RHH), then four-seam north, then slider/sweeper zone rate, changeup last.
- Every pen charted for first-pitch strike % and slider zone % — the two numbers that separated AAA (57% / 43%) from the big-league stint.
- Live ABs vs RHH only in February — that's the split that cost him (4 HR, .346 AVG at MLB).

Arsenal table combines AAA and MLB tracked pitches (1,766). RV/100 and xwOBA are weighted across both levels; Stuff+/Location+ are MLB only.
