

A lost year: four AAA starts in April(10.69 ERA), then nothing until August 18, then six AA outings(6.62 ERA, 7 HR in 17.2 IP). 33.2 innings total, 10 HR, 15.4 K%. The tracked April data shows why: 90.9-mph four-seam from a 6.4-ft release, an 88-mph cutter that got crushed (68% hard-hit), and five pitches all thrown 14–27% — no primary, no putaway.

VELO TREND

FASTBALL VELO BY MONTH (mph)

WHO HE WAS IN 2026

- Velo is the problem:** four-seam 90.9 (max 93.2), sinker 90.5, from a 6'6" frame with 6.2 ft extension. 15.7" IVB is fine; at 91 it's 92 EV and 69% hard-hit.
- The cutter (88.3, 9.7" IVB / -4") was the most-used pitch (27%) and the worst:** 13.6% whiff, 93 EV, 68% hard-hit, -3.6 RV/100. It's a slow four-seam with a little cut.
- Sinker was the best pitch by value (+2.2 RV/100):** 90.5, 10" / 13" run, 78 EV, 23% hard — 30% usage vs RHH. That is the pitch to build around at this velo.
- Slider (82.8, 3" / -9.7") gets chased (44%) but doesn't miss (13.6% whiff);** curve (76.7, -10 / -11) is the only true whiff shape and he throws it 25% for strikes.
- Lefties: .424 AVG, 171 BB%, 3 HR in 41 AAA PA; 5 HR in 37 AA PA.** There is no LHH plan — the changeup was 3 pitches all year.
- Release height 6.4 ft at a 39° slot** — the highest in this group by half a foot; the movement plot says the arm is over the top of everything.

OFFSEASON PLAN — WHAT WE FIX every item is tied to a 2026 number; nothing gets credited until game data confirms it

MOCAP & DELIVERY

- First capture of the winter is the full delivery: 6.4 ft release, 39° slot, 6.2 ft extension at 6'6" — find out where the velo is leaking (stride, hip-shoulder timing, arm path).
- Given the four-month absence, run the full physical assessment (ROM, strength, asymmetry) before any throwing load is set.
- Test a slightly lower slot in the lab — if the sinker/cutter shapes improve and velo ticks up, that's the direction.

PITCH SHAPES & GRIPS

- Sinker becomes the primary (40%+):** it's the only fastball that got soft contact. Four-seam to a north-only change-up (≤ 20%).
- Retire the cutter until it has a shape:** 9.7" IVB / -4" at 88 is not a pitch. If it comes back, it's 90+ with ≤ 6" IVB.
- Build the changeup vs LHH** — 3 pitches thrown all year vs a split that hit .424 / 5 HR. Target 82–84 with 14"+ run off the sinker.
- Curve stays as the whiff pitch; slider gets a sharper gyro shape or folds into the curve.

STRENGTH & WORKOUTS

- Velo is the offseason: 91 → 94 is the difference between a AA arm and a big-league one. Mass (200 lb at 6'6"), lower-half power, intent throwing once cleared.
- Return-to-load plan built on the assessment — he lost four months; the ramp has to be measured, not assumed.

BULLPENS & PLAN

- Sinker/changeup pens vs a LHH stand-in; every pen charted for arm-side command.
- No cutter in pens until the mocap says the slot can produce a real one.
- Live ABs vs LHH in February: the .424 split is the gate — under .320 xwOBA before we credit anything.

Arsenal from 283 AAA tracked pitches (April). AA innings (August–September) have no public pitch tracking — result only. RV/100 and xwOBA from AAA tracking.
